

Wells building solutions are the optimal choice for repairing or building safe, long-lasting roads, bridges and noise barrier walls. By partnering with the leader in precast concrete, your projects will be completed faster and more cost-effectively than ever before.

Working Together.

We take great pride in our ability to closely partner with general contractors and state organizations to ensure the successful completion of infrastructure improvements. Our upfront collaborative approach allows us to navigate contracts and develop safe, solid solutions.

Minimizing Impact.

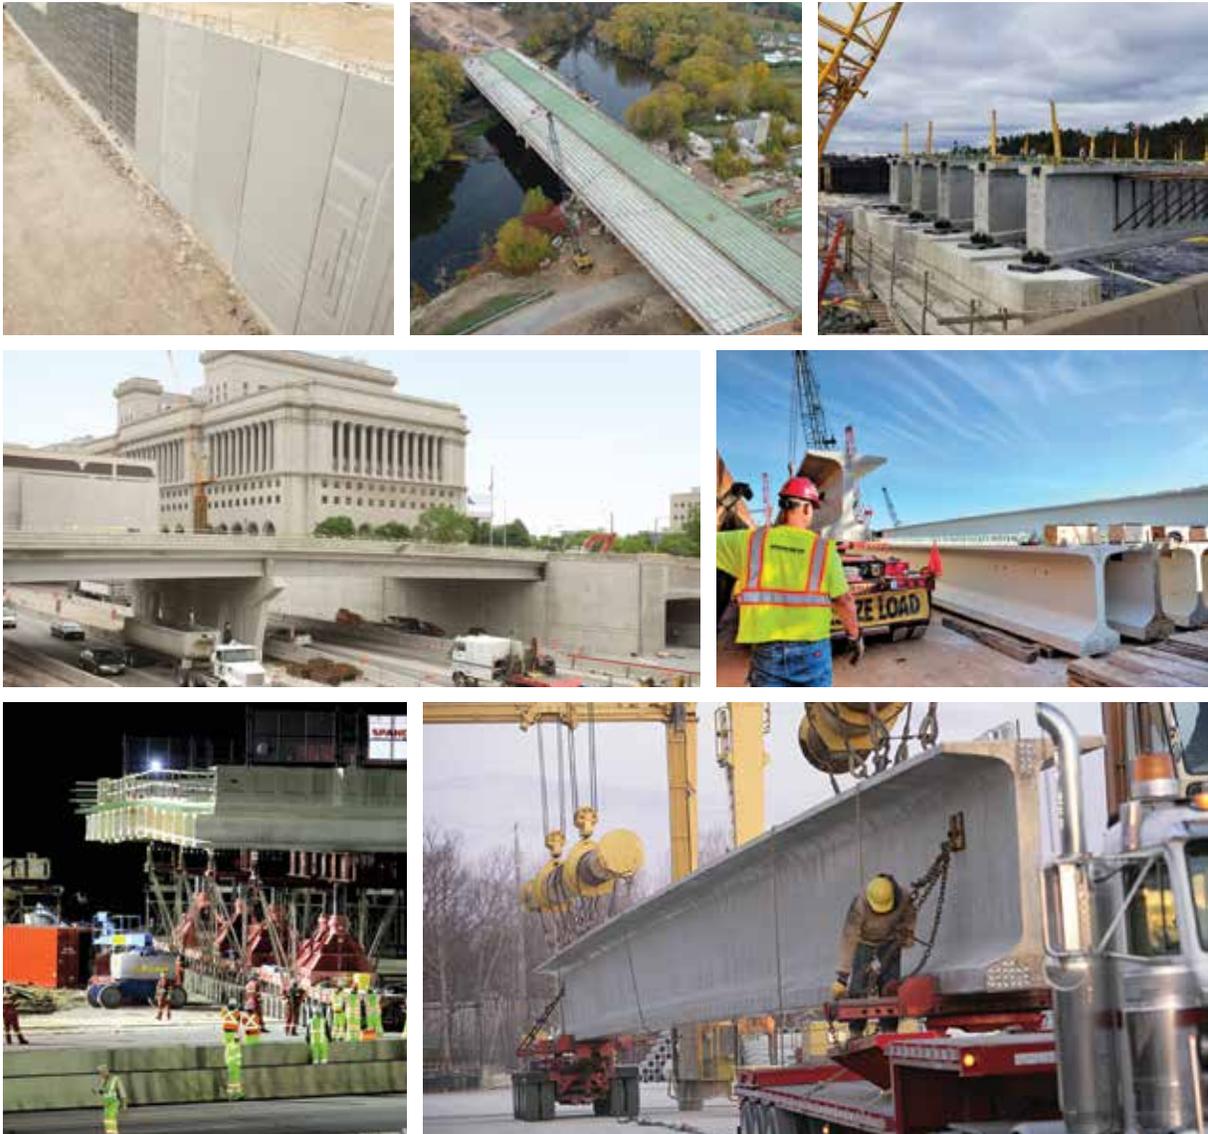

Bridge and road rehabilitation and installation projects cause traffic disruption and safety concerns, while complete closures can adversely affect a local economy and add undue stress to residents. Because of our meticulous planning, and world-class production capabilities, we can reduce construction timetables from months down to weeks. Our precast, pre-stressed bridge solutions can be assembled onsite, with pieces delivered as needed, providing engineers and their crews with the flexibility needed for challenging projects.

Building a Safer Tomorrow.

Wells precast products offer a structurally sound, safe and cost effective solution that won't require constant maintenance and observation. As the industry leading experts on precast concrete, we know our products will stand up to constantly shifting environmental conditions and heavy traffic. From virtual design to installation, we will work with you to create legendary structures. Wells products can and will stand the test of time, and in turn build a safer tomorrow.

The Wells Difference

Wells precast concrete products offer unmatched versatility for transportation projects ranging from complex bridges and overpasses to road paving, noise barrier walls and more. Every project is treated as an opportunity to work side-by-side to create something impressive. No matter the project, our durable precast components can be installed quickly, making Wells precast solutions a cost-effective and minimally disruptive infrastructure solution.
